

A. Rayleigh Quotient as Spectral Average

$$K_i = \frac{\langle w_i, Sw_i \rangle}{\|w_i\|^2}$$

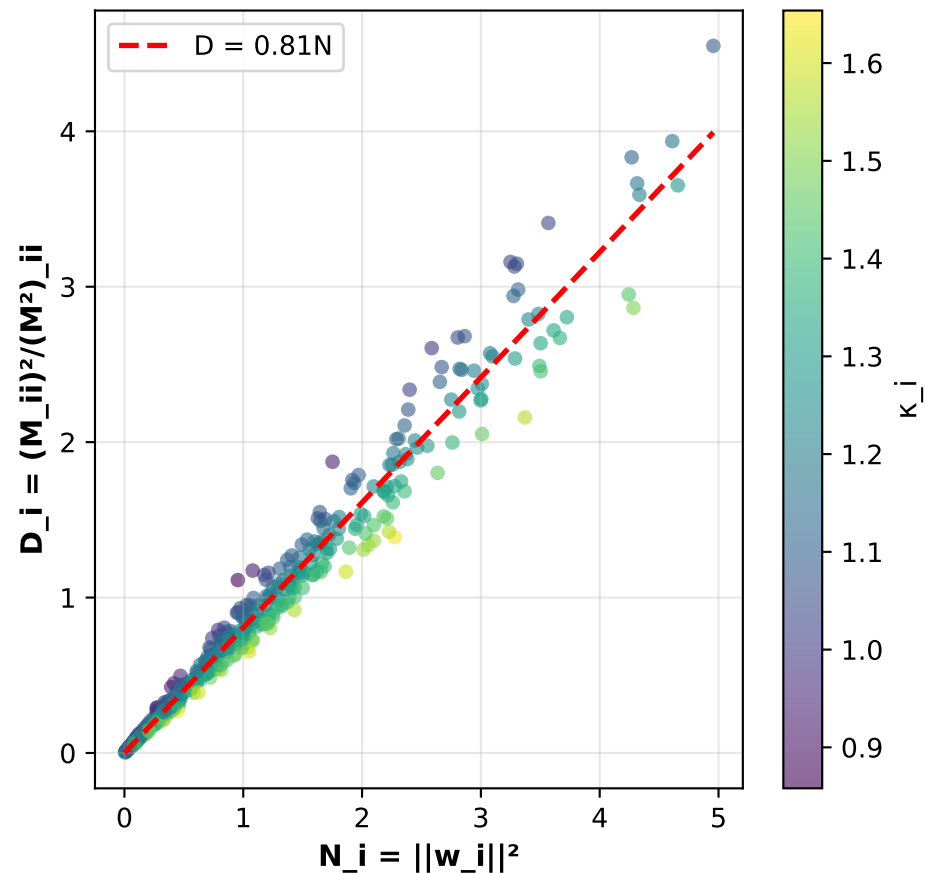

where $S = WW^T$ (Frame Operator)

$$= \sum_k p_{ik} \lambda_k$$

with $p_{ik} = \frac{|u_k^T w_i|^2}{\|w_i\|^2}$

$$\sum_k p_{ik} = 1 \text{ (probability measure)}$$

B. Cross-Sectional D vs N

C. Slope-Eigenvalue Relationship
